BERKE ALPASLAN

Backend Developer (.NET / C#) | Network & DevOps Explorer

İzmir, Turkey | +90 537 391 49 79 | alpaslanberke@gmail.com | linkedin.com/in/berkealpaslan | github.com/BerkeAlpaslan | berke-alpaslan.vercel.app

SUMMARY

Computer Engineering graduate with a solid backend foundation in C# and ASP.NET Core, building clean, maintainable systems using Clean Architecture, CQRS, and modern design patterns. Hands-on experience with database migration systems, API release validation, and security testing gained through a professional consulting internship. Actively expanding into DevOps and infrastructure (Docker, CI/CD, networking) with a strong self-learning track record. Seeking a Backend Developer role with room to grow toward infrastructure and DevOps.

SKILLS

Backend: C#, ASP.NET Core, Entity Framework Core, REST API, gRPC, SignalR

Architecture & Patterns: Clean Architecture, Onion Architecture, CQRS, Repository Pattern, Mediator, Result Pattern, SOLID Principles, Domain-Driven Design (DDD)

Databases & Messaging: PostgreSQL, SQL Server, Liquibase (DB migrations), RabbitMQ, MassTransit

DevOps & Infrastructure: Docker, Docker Swarm, Linux, Git/GitHub, CI/CD, GitHub Actions

Testing & QA: K6 (load/release testing), OWASP ZAP (penetration testing), Semgrep, Horusec, Security Code Scan (SAST)

Networking: C, TCP/UDP Socket Programming, Multi-Threading & Concurrency, OSI Model, DNS, VPN (Tailscale)

Frontend & Other: TypeScript, Angular, Blazor WASM, Postman, Visual Studio, VS Code

Languages: Turkish (Native), English (B2)

EXPERIENCE

Backend Developer — Egebis Bilgi İşlem Çözümleri

Feb 2026 – Present

Internship → Part-time (SAP consulting & software development firm)

- Design and implement a Liquibase-based database migration system for a multi-tenant PostgreSQL architecture, including changelog automation and a multi-tenant update workflow, adopted as the team's migration-first standard.
- Own release validation using K6 across a growing suite of 300+ API endpoints, performing root-cause analysis on HTTP errors (e.g. column-name mismatches) and reporting fixes prior to release.
- Build and run a gray-box penetration testing workflow with OWASP ZAP's Access Control Testing add-on to identify authorization gaps in backend APIs.
- Evaluate static application security testing (SAST) tools — Semgrep, Horusec, and Security Code Scan — for .NET codebases, integrating SARIF-based reporting.
- Propose CI/CD architecture (Liquibase + GitHub Actions) to management, and research Docker Swarm deployment and server configuration by shadowing the release manager.
- Contribute to an actively evolving ASP.NET Core product through backend development, code review, and GitHub-based team workflows including branch management.

Backend Developer Intern — SednaCloud

Jul 2024

Summer Internship (1 month)

- Built the backend of a hotel reservation system largely single-handedly using ASP.NET Core, applying Onion Architecture, CQRS, MediatR, and the Generic Repository pattern.
- Gained first professional exposure to REST API design, Angular's non-standalone module architecture, and full-stack team collaboration.

PROJECTS

FoodResQ — Food Waste Prevention Platform (Graduation Project) | C#, .NET 10, Clean Architecture, DDD, CQRS, Blazor WASM, PostgreSQL, Redis, SignalR

- Designed a Clean Architecture / DDD platform connecting businesses with surplus food to consumers, using CQRS via Mediator, EF Core, and .NET Aspire for orchestration.
- Implemented Redis caching with documented TTL and invalidation strategies, domain event dispatching, and 34 unit tests; delivered a full academic report with PlantUML use-case and object diagrams.

Pizza Delivery Simulator 3000 | C#, .NET 8, TCP/UDP Socket Programming

- Built a real-time multi-driver coordination system demonstrating concurrent TCP/UDP network programming, achieving the top grade in the Computer Network Programming course.

Ferry Tour Multi-Threaded Simulation | C, Multi-Threading, Concurrency

- Built a multi-threaded simulation of a ferry transport system handling cars, minibuses, and trucks across four toll booths, vehicle queues, and ferry loading/unloading.
- Designed concurrency mechanisms using mutexes and semaphores to prevent race conditions and manage shared resources safely.

MediSync API + CLI | C#, ASP.NET Core, TypeScript, REST API

- Developed a medical synchronization platform with a RESTful API backend and a TypeScript CLI client.

PawMatch API | C#, ASP.NET Core, Design Patterns, SOLID

- Built a pet adoption matching API applying design patterns and SOLID principles for a Software Engineering course, using Kanban/Jira/Confluence for project management.

gRPC File Transfer / MassTransit + RabbitMQ Samples | C#, gRPC, MassTransit, RabbitMQ

- Implemented gRPC server/client streaming for binary file transfer, and explored message queue exchange patterns with MassTransit and RabbitMQ.

EDUCATION

B.Sc. in Computer Engineering — Manisa Celal Bayar University
GPA: 3.53/4.00 – High Honor
